Abstract

In this article, we accomplish two things. First, we show that despite empirical psychologists' nominal endorsement of a low rate of false-positive findings ($\leq .05$), flexibility in data collection, analysis, and reporting dramatically increases actual false-positive rates. In many cases, a researcher is more likely to falsely find evidence that an effect exists than to correctly find evidence that it does not. We present computer simulations and a pair of actual experiments that demonstrate how unacceptably easy it is to accumulate (and report) statistically significant evidence for a false hypothesis. Second, we suggest a simple, low-cost, and straightforwardly effective disclosure-based solution to this problem. The solution involves six concrete requirements for authors and four guidelines for reviewers, all of which impose a minimal burden on the publication process.

Why QRPs?

Scientists employ QRPs because...

- Significant results get published and publishing is necessary for a career
 - Shamoo & Resnick, 2003; Song et al., 2000; Tijdink et al., 2014
 - They are socialized to do so by mentors and environments
 - Swazey et al., 1993; Versteege, 2013
- ...but there is little research looking at proximal predictors for these processes!

Why QRPs?

Scientists employ QRPs because...

- Significant results get published and publishing is necessary for a career

Shamoo & Resnick, 2003; Song et al., 2000; Tijdink et al., 2014

Possible proximal predictors:

- Expectation of reward from significant results
- Stress

Why QRPs?

Scientists employ QRPs because...

- They are socialized to do so by mentors and environments

Swazey et al., 1993; Versteege, 2013

Possible proximal predictor:

- Attitudes of mentors towards QRPs
- Belief in scientific value of significant results
- Motivation to do good work

QRPs in psychology

Students are an important group to investigate!

- Future researchers and leaders of the academic field
- Proper development of critical faculties for research findings as nonacademic professionals
- Purest expression of the field's commitment to high scientific standards

What is going on with QRPs in
the student world?

QRPs in psychology

- The final thesis is the most direct measure of a student's ability to apply scientific principles
- Several possible structural similarities exist between predictors of QRP use in scientists and those in students

Why QRPs?

Scientists employ QRPs because...

- Significant results get published and publishing is necessary for a career

Shamoo & Resnick, 2003; Song et al., 2000; Tijdink et al., 2014

Possible proximal predictors:

- Expectation of reward from significant results
- Stress

Why QRPs?

Students may employ QRPs because of perceptions that...

- Significant results lead to better grades
- The advisor expects significant results
 - Significant results are more useful for the advisor!
- Stress
 - Trying to get a simple “story” from the data to ease writing the thesis

Why QRPs?

Scientists employ QRPs because...

- They are socialized to do so by mentors and environments

Swazey et al., 1993; Versteege, 2013

Possible proximal predictor:

- Attitudes of mentors towards QRPs
- Belief in scientific value of significant results
- Motivation to do good work

Why QRPs?

Students may employ QRPs because of perceptions that...

- The advisor thinks of QRPs as good practice
- Significant results are a sign of good science

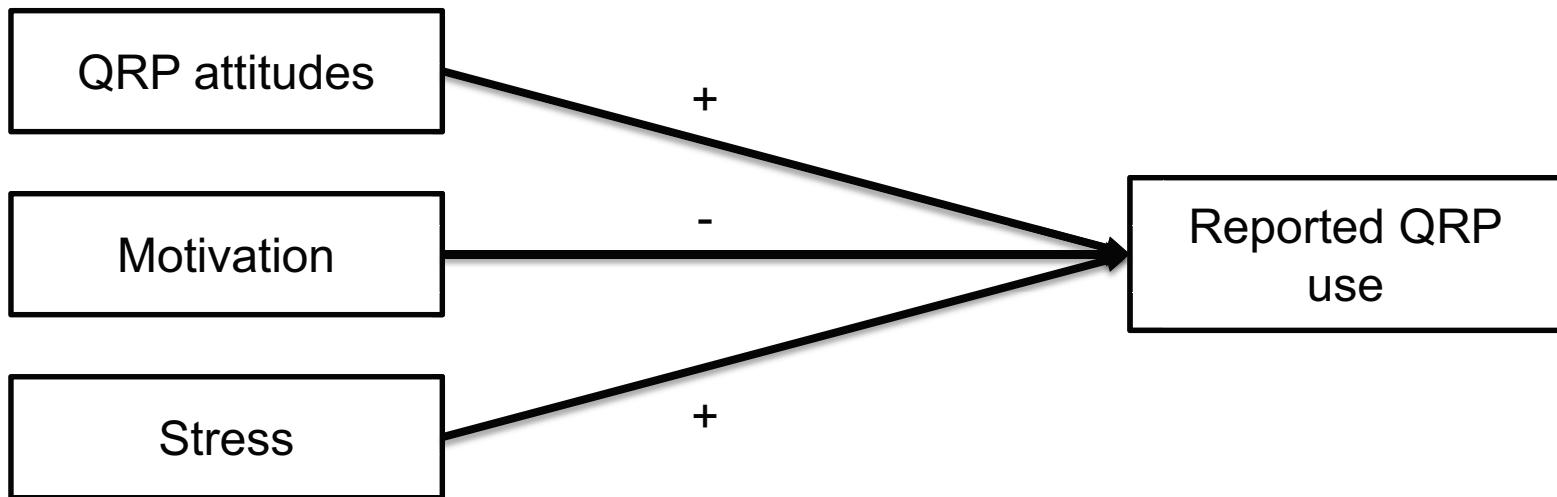

...or because of low motivation to do conscientious work.

Theses – research questions

- How prevalent are QRPs in student theses?
- What attitudes and circumstances lead students to engage in QRPs?
- What influence do advisor attitudes have on students' QRP use?
- Do structural aspects of thesis work affect QRP use?
 - Students may have less control over design aspects of their work than over reporting or analysis

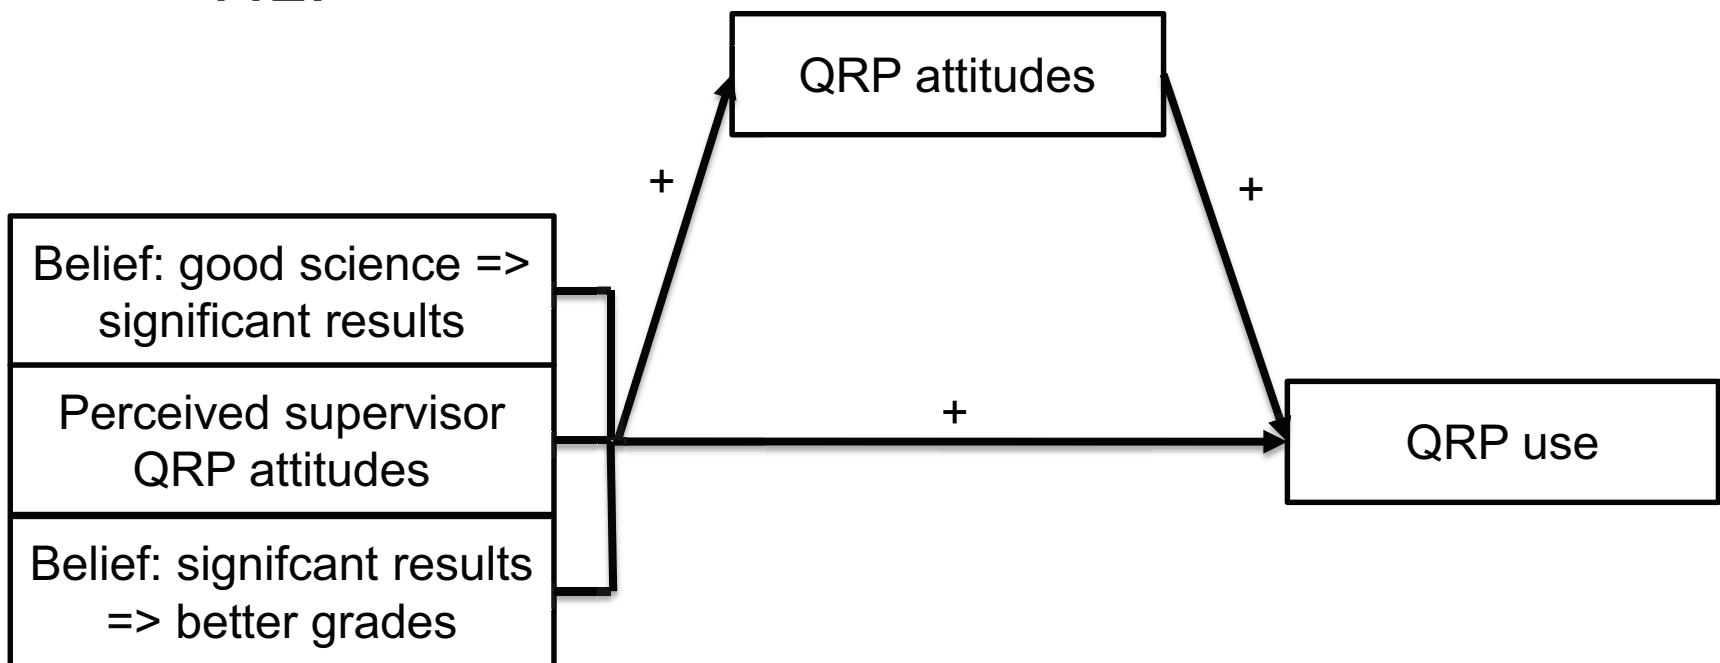

Hypotheses

H1:

Hypotheses

H2:

Hypotheses

H3: All relationships should be stronger for reporting and analysis QRPs than for study design QRPs

Data collection

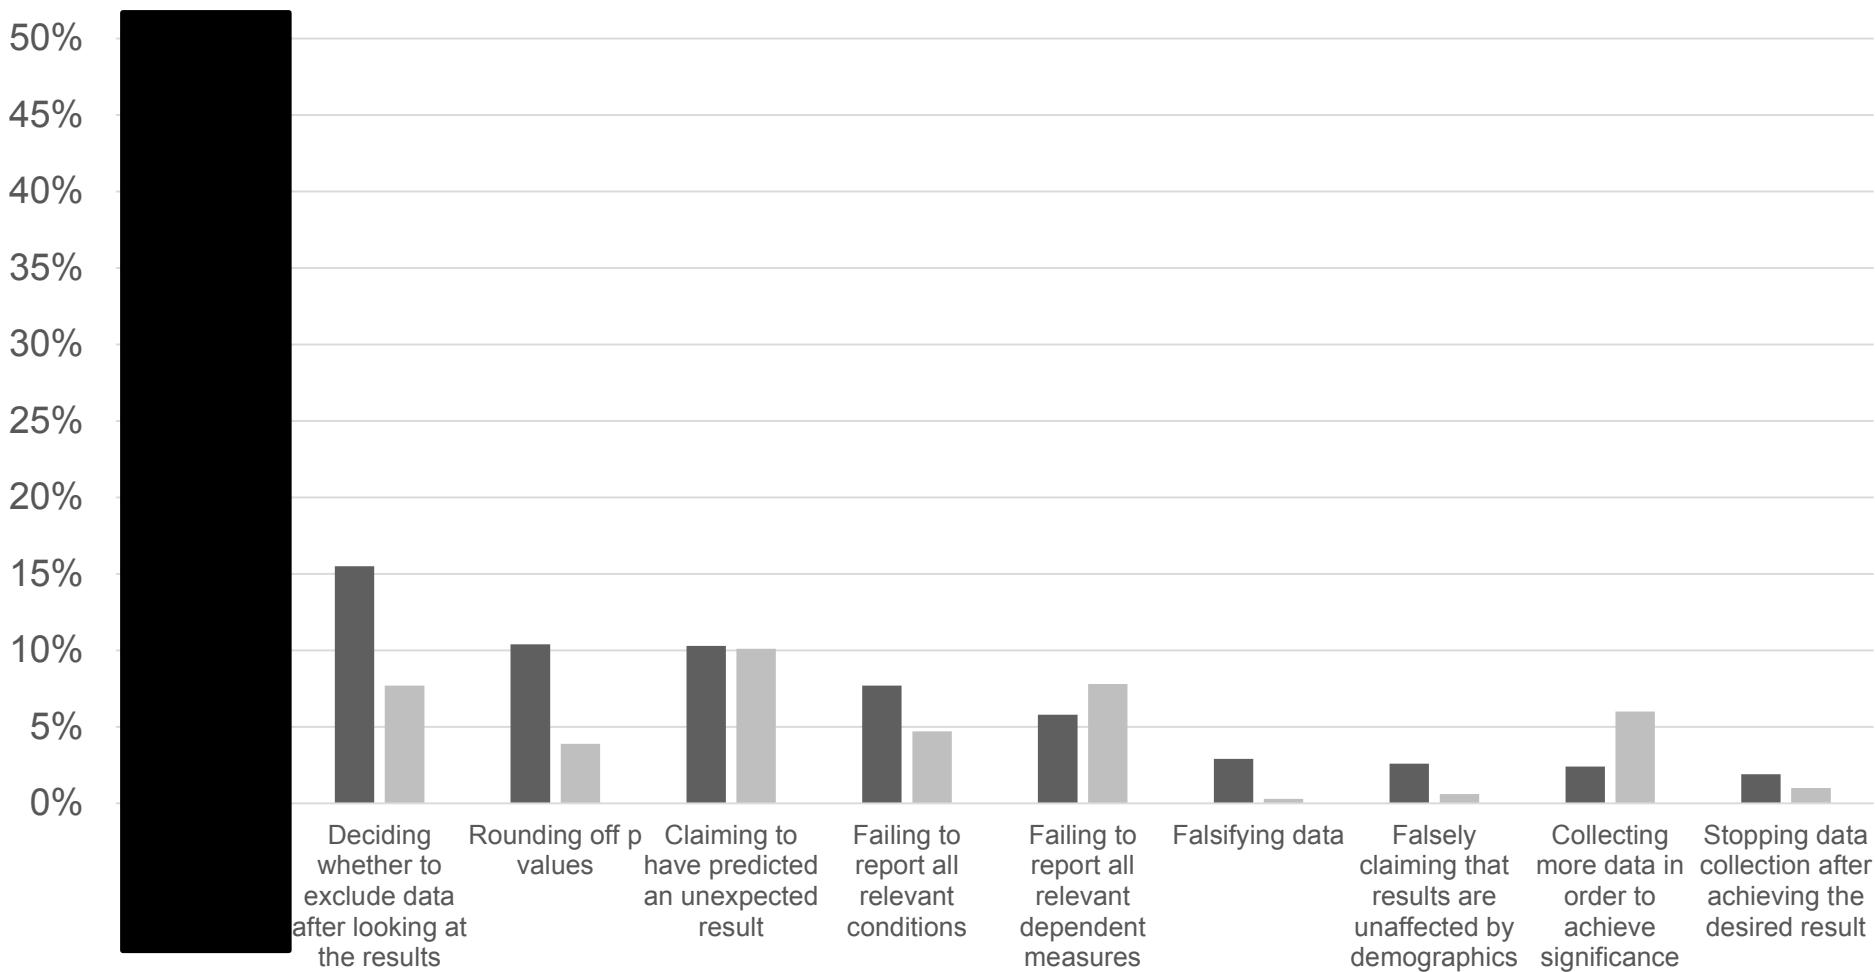

- Data from $N = 207$ students (varies by analysis due to nonresponses)
- QRPs taken from Fiedler & Schwarz (2016), Questions on:
 - implementation in thesis (yes/no)
 - own attitude
 - perceived supervisor attitude(attitude items scored 1 – problematic to 5 – sensible)
- All questions had “don’t know” option

Survey contents

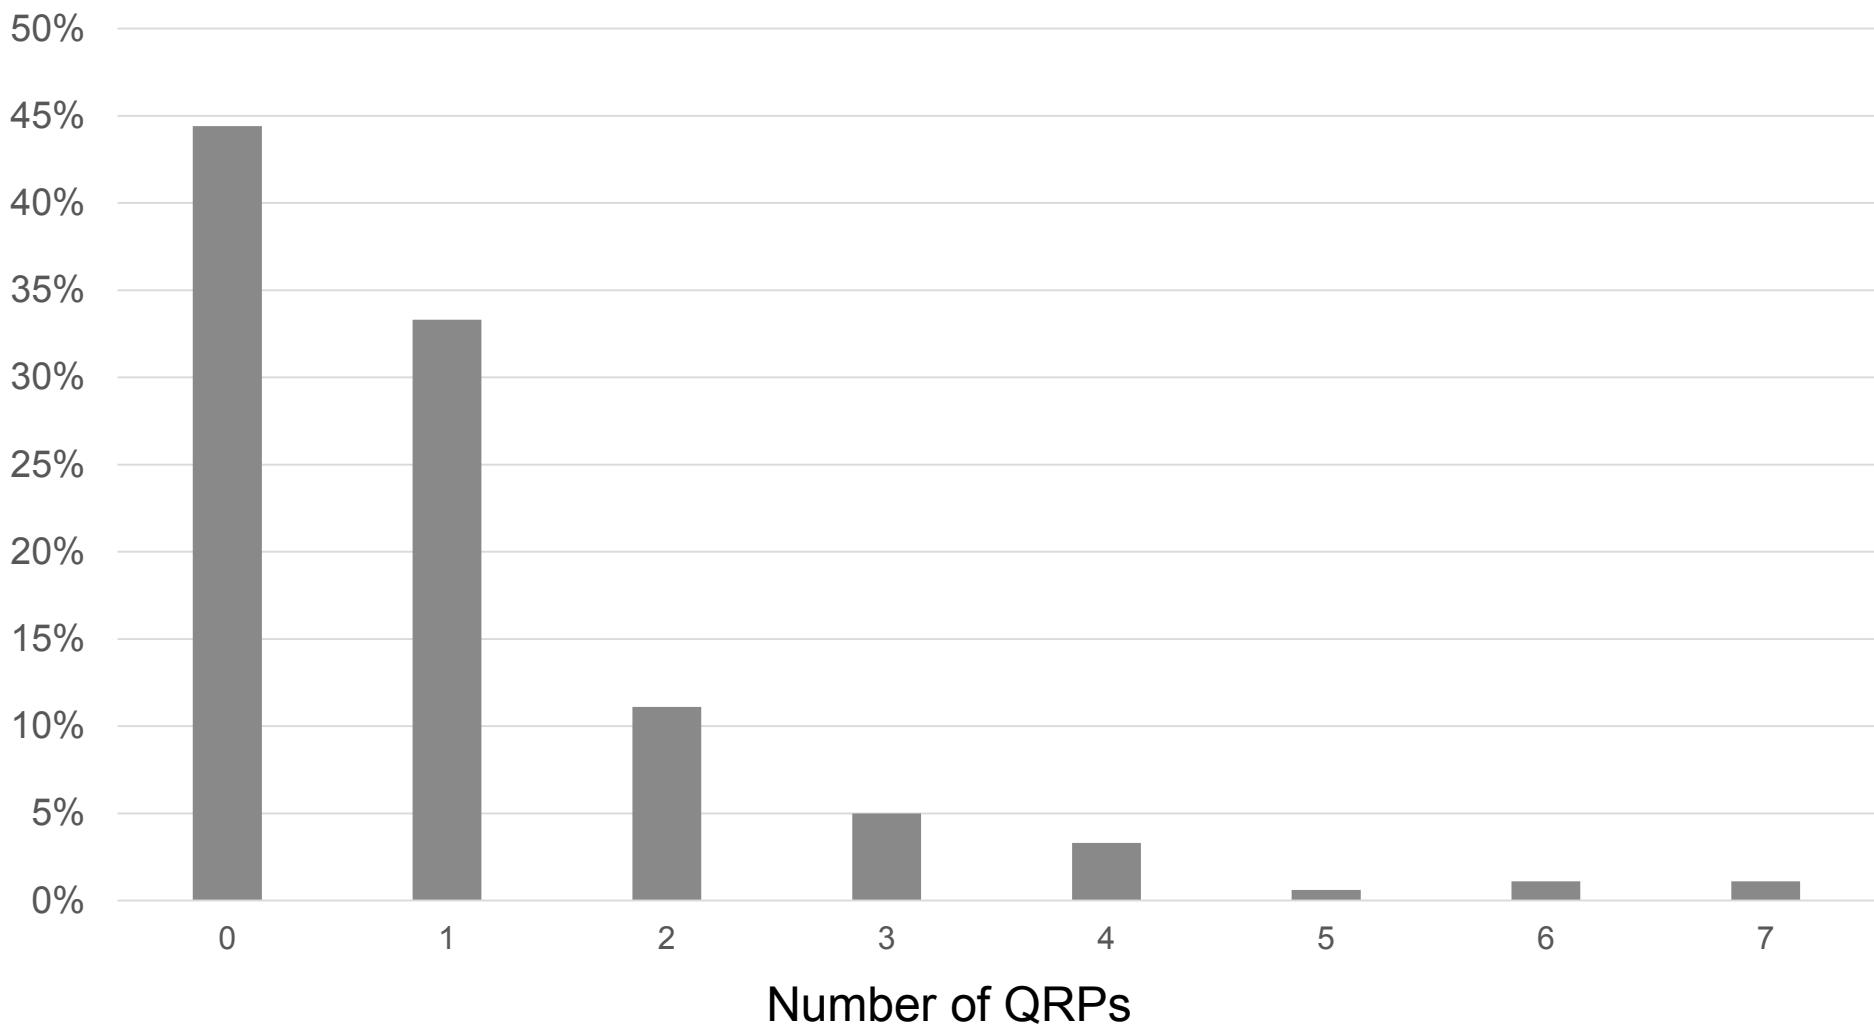

- Lists of QRPs taken from Fiedler & Schwarz (2016), augmented with an item on HARKing and four distracter items (e.g. “performing a power analysis”)
 - Ich habe im Rahmen meiner Abschlussarbeit mindestens einmal... (ja/nein/weiß nicht)
 - [QRP] finde ich... (1 „problematisch“ – 5 „sinnvoll“ oder „weiß nicht“)
 - [QRP] findet mein Betreuer... (1 „problematisch“ – 5 „sinnvoll“ oder „weiß nicht“)

Self-reported prevalence

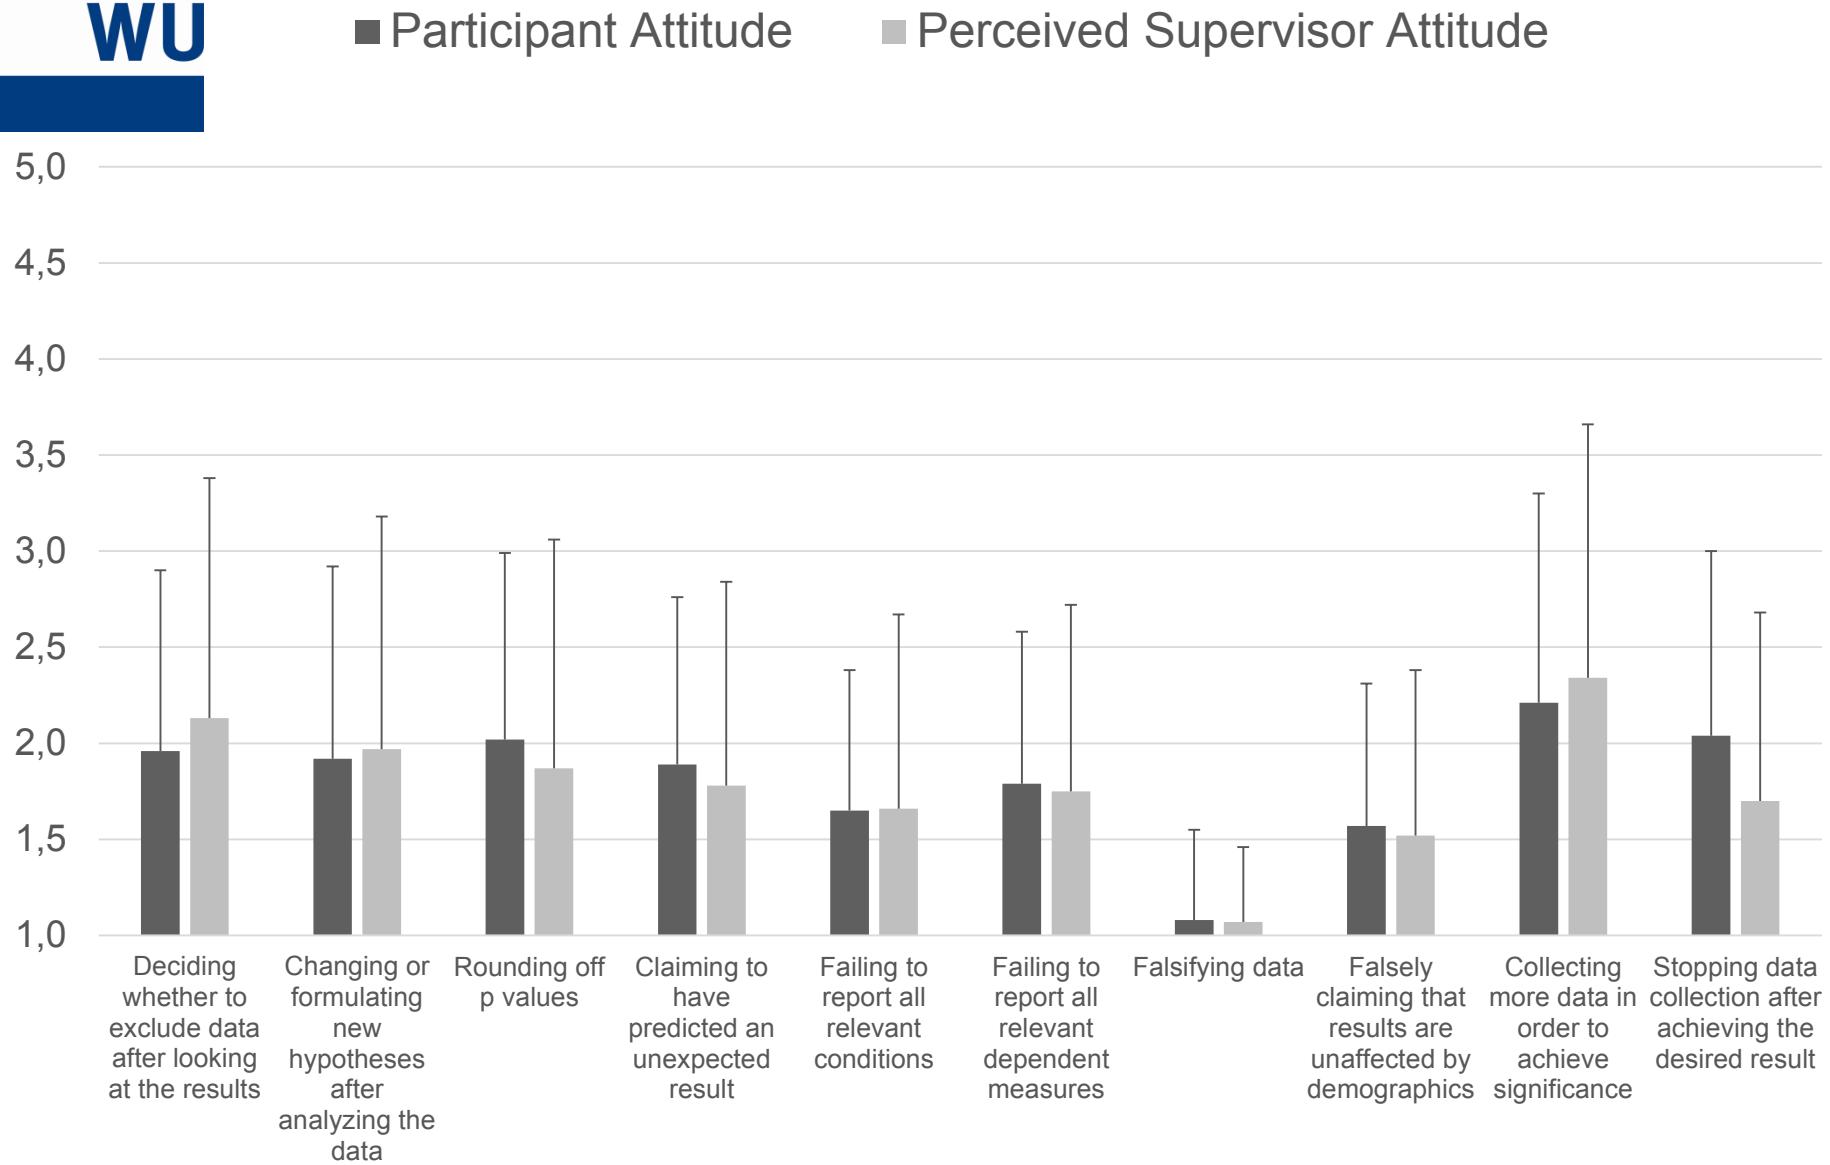

■ Prevalence current study ■ Prevalence Fiedler & Schwarz (2016)

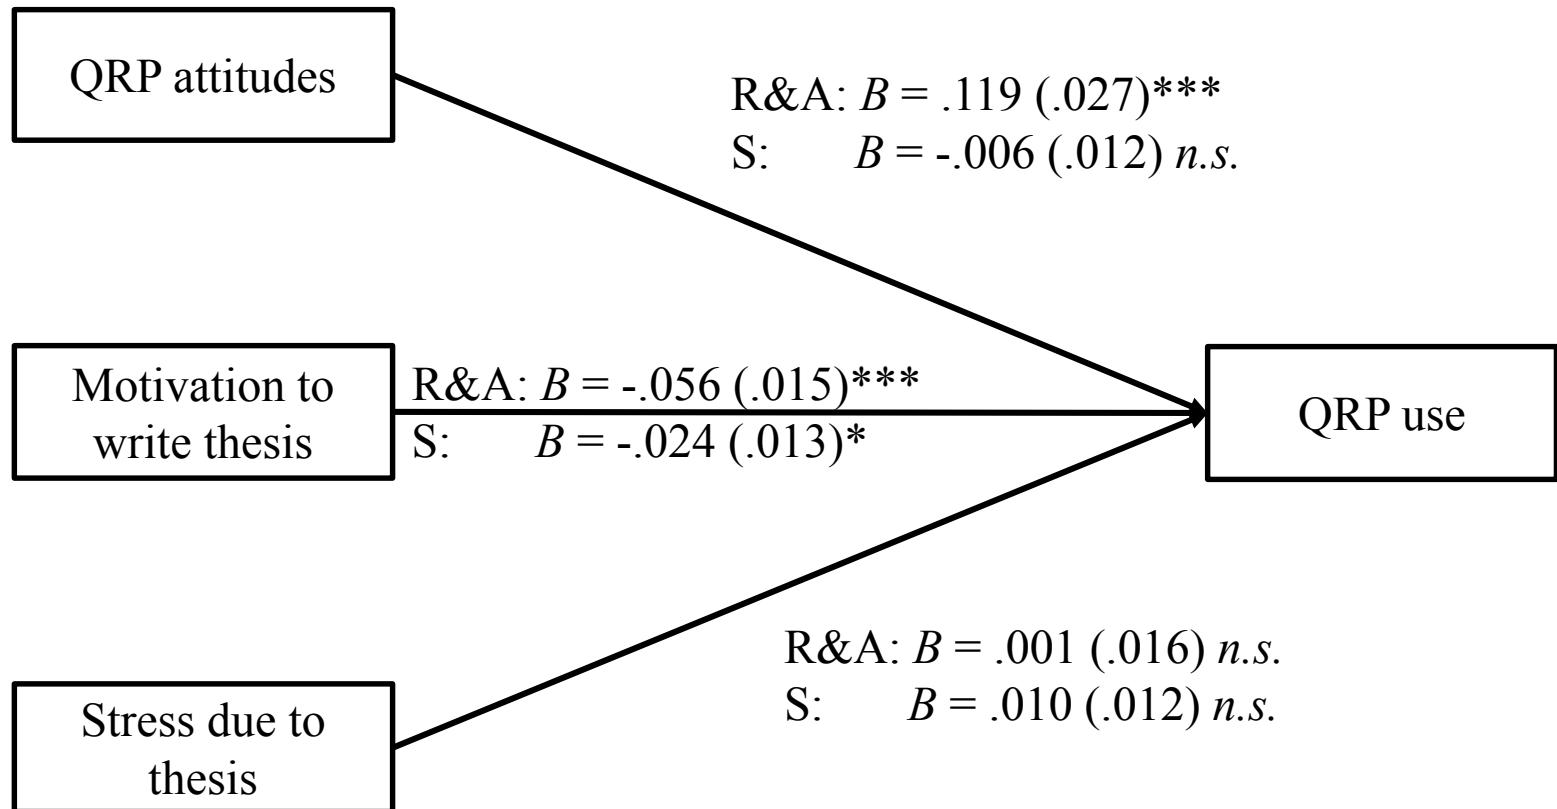

Percentage of students reporting engaging in multiple QRPs

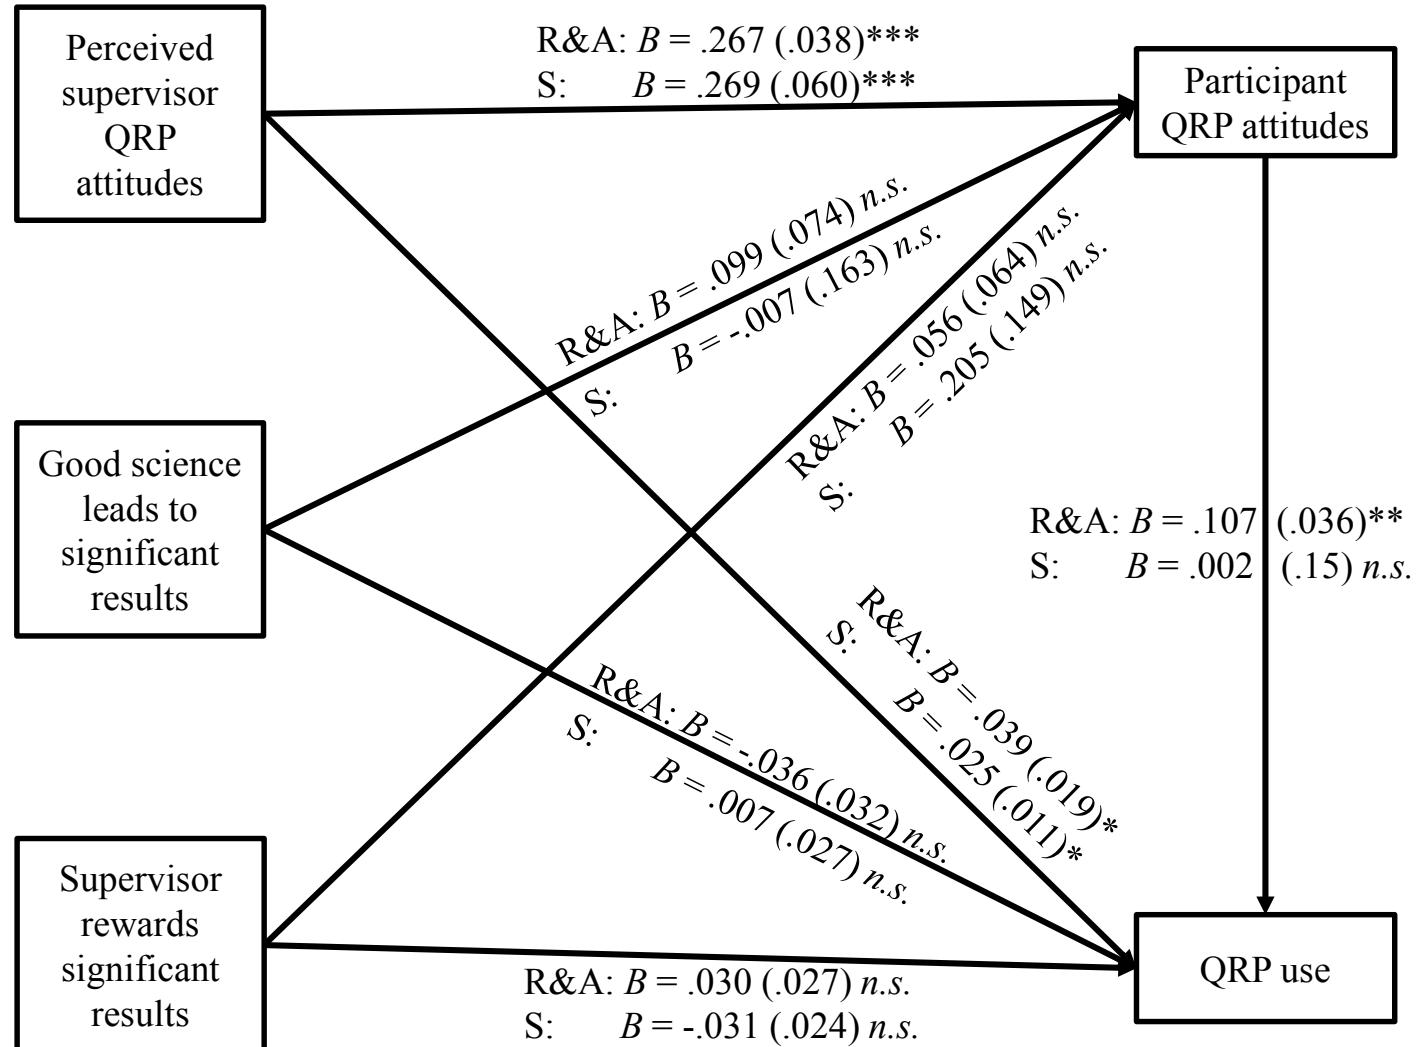

Attitudes towards QRPs

Results

Results

Limitations

- Self-report study
 - Social desirability?
 - Fear of repercussions?
 - Participants competent to judge QRP use?
- Cross-sectional design
 - Causality issues: do attitudes predict QRP use or does QRP use bias attitudes? Do students infer supervisor attitudes from their own?
 - Participants able to judge supervisor attitudes accurately?

Conclusion

- Motivation appears to be a protective factor in student QRP use
- Student attitudes towards QRPs predict their use
 - Only when they have influence, i.e. in reporting and analysis!
- Student's perception of their supervisor attitudes shapes their own attitudes and affects their reported QRP use directly
- Beliefs about significance may affect student QRP use, but if so, their influence is small

Implications

- Teaching
 - Supervisors must be careful what attitudes they project to students!
 - Motivating students might encourage them to avoid QRPs
- QRP use in academia
 - Students' reported QRP use is comparable to that of career academics
 - Students do not endorse QRP use at the start of their career
 - Academic collaborators' role (as data analysts, authors, etc.) can dictate in which QRPs they engage

THANKS FOR THE ATTENTION!!!

Survey contents

- General motivation (3 items, $\alpha = .62$)
„Ich finde das Arbeiten an meiner Abschlussarbeit spannend und interessant“
- Stress (3 items, $\alpha = .82$)
„Die Arbeit an meiner Abschlussarbeit ist für mich belastend“

Survey contents

- Significant results important for grade (3 items, $\alpha = .81$)
„Meine Note hängt davon ab, ob meine Ergebnisse signifikant sind“
- Good science produces significant results (3 items, $\alpha = .65$)
„Ein Nulleffekt heißt für mich, dass ich keine gute Arbeit geleistet habe“
