How smart do you think you are?

A meta-analysis on the validity of self-estimates of cognitive ability

Philipp Alexander Freund and Nadine Kasten

Hypotheses

Overall Relationship: Most studies investigating the relationship between self-estimates of cognitive ability and psychometric test scores are significant, positive correlations. We therefore expect to find a significant, positive overall relationship between the two variables

Moderator Analysis: We hypothesize that self-estimates concerning verbal, numerical, or spatial abilities should be more valid than self-assessments of general cognitive ability, which in turn is usually a compound of different subabilities (as implemented in omnibus test batteries). Consequently, use of these "standard" abilities should also result in more valid self-estimates than use of more rarely assessed abilities, such as memory or processing speed, for instance.

Publication Bias

We also performed a funnel plot analysis to investigate if there was any kind of publication bias toward over- or underpowered studies in our data set. As the figure shows, the majority of the effect sizes have rather low standard errors (smaller than 0.1), meaning that they were estimated with a reasonable degree of precision. Also, there appears to be a moderately asymmetric relationship between the magnitude of effect sizes and their standard errors, there is practically no reason to assume that publication bias is a problem in the present meta-analysis. The funnel plot also gives evidence for heterogeneity among effect sizes.

Registered Reports Workshop 2018

Copy of Information Recommended for Inclusion in Manuscripts Reporting Meta-Analyses

Description Guidelines & Warnings Materials **Steps** +SHARE VIEW All changes saved

Title

1 State the research question and type of research synthesis (e.g., narrative synthesis, meta-analysis).

Author note

2 List all sources of monetary and in-kind funding support; state the role of funders in conducting the synthesis and deciding to publish the results, if any.

Describe possible conflicts of interest, including financial and other nonfinancial interests.

Give the place where the synthesis is registered and its registry number, if registered.

Provide name, affiliation, and e-mail address of corresponding author.

Abstract

3 **Objectives:**

State the research problems, questions, or hypotheses under investigation.

Abstract

4 **Eligibility criteria:**

Describe the characteristics for inclusion of studies, including independent variables (treatments, interventions), dependent variables (outcomes, criteria), and eligible study designs.

Abstract

5 **Methods of synthesis:**

Describe the methods for synthesizing study results, including

- Statistical and other methods used to summarize and to compare studies
- Specific methods used to integrate studies if a meta-analysis was conducted (e.g., effect-size metric, averaging method, the model used in homogeneity analysis)

Abstract

6 **Results:**

State the results of the synthesis, including

- Number of included studies and participants, and their important characteristics
- Results for the primary outcome(s) and moderator analyses
- Effect size(s) and confidence interval(s) associated with each analysis if a meta-analysis was conducted

Disciplinary Repository for Psychological Science

PsychArchives is a disciplinary repository preserving a variety of digital research objects (DROs), with 21 different publication types (preprints, primary, and secondary publications), research data, tests, preregistrations, multimedia and code. We provide easy and free access to DROs according to the FAIR principles, which implies the commitment to ensure that research and research data are findable, accessible, interoperable, and reusable.

PsychArchives in a nutshell

Shared Digital Research Objects (DRO)
- research outputs from the entire cycle psychological research are welcome.

Citable and discoverable
- uploads are assigned a Digital Object Identifier (DOI) to make them easily and uniquely citable.

Open licensing
- fostering re-use and open science

Safe
- your research output is stored the future at a sustainable, public infrastructure.

DataWiz is a free data management system that helps prepare research data.

DataWiz ...

- facilitates high-quality documentation according to current standards.
- enables collaborative and distributed work on projects.
- ensures the long-term reusability of research data.

DataWiz covers the entire research data management process:

- Organize and document research projects
- Create data management plans adapted to the requirements of various sponsors (BMC, DFG)

Archiving and reuse

- Export study documentation for preregistrations
- Work together with specific assignment of access rights
- Import and version control records
- Read variable descriptions from SPSS and convert into codebooks
- Convert to relevant data formats

Getting started with DataWiz:
You need a DataWiz account that you can create here. After logging in with your DataWiz user...

Is Psychology Still a Science of Behaviour?

▼ Dariusz Doliński

Abstract ▲

Since the 1970s, social psychology has examined real human behaviour to an increasingly smaller degree. This article is an analysis of the reasons why this is so. The author points out that the otherwise valuable phenomenon of cognitive shift, which occurred in social psychology precisely in the 1970s, naturally boosted the interest of psychologists in such phenomena like stereotypes, attitudes, and values; at the same time, it unfortunately decreased interest in others, like aggression, altruism, and social influence. In recent decades, reactions holds greater importance than demonstrating the conditions under which people display certain reactions. This assumption has been accompanied by the spread of statistical analysis applied to empirical data, which has led to researchers today generally preferring to employ survey studies (even if they are a component of experiments being conducted) to the analysis of behavioural variables. The author analyses the contents of the most recent volume of "Journal of Personality and Social Psychology", and argues that it is essentially devoid of presentations of empirical studies in which human behaviours are examined. This gives rise to the question of whether social psychology remains a science of behaviour, and whether such a condition of the discipline is desirable.

Keywords ▲

social psychology, behavioural research, dichotomic variable, uncertainty principle

The eruption of the scandal involving academic fraud committed by Diederik Stapel led to the emergence of a large number of exceptionally important initiatives among social psychologists that addressed the crisis that had engulfed our discipline. Attention was drawn to the need to replicate studies, to place greater emphasis on effect size than on the significance of differences between averages, and the idea of pre-registration of studies was floated. And while we may not yet claim that social psychology is clearly and unequivocally in a better condition than a decade, or even several decades ago (Motyl et al., 2017), the mere fact of the developing debate on the subject and growing awareness of the issues involved is of fundamental importance.

The objective of this article, however, is to focus attention on an entirely different issue, itself also associated with social psychology. Before the beginning of the scandal associated with Stapel's fraud, the pages of *Perspectives on Psychological Science* published an article by Baumeister, Vohs, and Funder (2007) with the meaningful title "Psychology as the science of self reports and finger movements". The authors of this article pointed out that while psychology is defined as the science of behaviour, at present behaviours do not constitute the primary object of its interest. Insofar as both animal and developmental psychologists do, in fact, observe and analyse behaviours (as the authors jokingly suggest: maybe because they are incapable of inducing their subjects – animals and small children, all unable to write – to fill in surveys), in the case of social psychology, behaviours other than the completion of surveys...

Call for Papers - Hotspots in Psychology 2021

Call for Papers “Hotspots in Psychology 2021”

A Topical Issue of the Zeitschrift für Psychologie
Guest Editors: Michael Bošnjak,^{1,2} Nadine Kasten,² and Holger Steinmetz¹

¹ ZPID – Leibniz Institute for Psychology Information, Trier, Germany
² Department of Psychology, University of Trier, Germany

Focus of the Special Issue, Aims, and Scope

Research synthesis techniques such as systematic reviews and meta-analyses have become standard methods for aggregating the results from thematically related research in psychology. They can be used to describe the state of the art in a research field, to test and/or compare theories, and to derive conclusions about the effectiveness of interventions.

Ideally, research syntheses use transparent procedures to find, evaluate, and aggregate the results of relevant research. Procedures are explicitly defined in advance to ensure that all steps are transparent and replicable. This practice is designed to minimize bias and increase the trustworthiness of findings. Consequently, well-performed research syntheses may decisively contribute to shaping and/or resolving hotspot debates in psychology and beyond.

The overall aim of this topical issue is to address hotspot topics in all subfields of psychology and related areas with the aid of research synthesis methods. The topics covered may address:

- Systematic reviews aimed at identifying hotspot topics in psychology.
- Systematic reviews and meta-analyses on topics currently being debated in any subfield of psychology.
- Systematic reviews and meta-analyses contributing to the recent discussion about replicability, transparency, and research integrity in psychology.
- Meta-analytic replications and extensions of previously published syntheses, for example, by applying more recent approaches and/or by including more recent studies.

- modeling (MASEM), individual person meta-analysis (IPD), network meta-analysis, to name a few.
- Demonstrations and tools for data extraction, analysis, visualization, and interpretation of meta-analyses.
- Quality-appraisal approaches and instruments for primary, secondary, and meta-analytic studies.

How to Submit

There is a two-stage submissions process. Initially, interested authors are requested to submit extended abstracts of their proposed papers. Authors of the selected abstracts will then be invited to submit full papers. All papers will undergo blind peer review.

Stage 1: Structured Abstract Submission

Authors interested in this special issue must submit a structured abstract of the planned manuscript before submitting a full paper. The goal is to provide authors with prompt feedback regarding the suitability and relevance of the planned manuscript to the special issue.

The deadline for submitting structured abstracts is December 1, 2019.

Feedback on whether or not the editors encourage authors to submit a full paper will be given by December 31, 2019.

Submission Guidelines for Structured Abstracts

Structured abstracts should be within four pages and may encompass information on each of the following heading(s): (a) Background, (b) Objectives, (c) Research question(s) and/or hypothesis/es, (d) Method/Approach, (e) Results/Findings, (f) Conclusions and implications (expected).

Deadline
December 1, 2019
