Introduction
Coronavirus disease 2019 (COVID-19) is an infectious illness caused by a newly discovered coronavirus now called severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2; formerly called 2019-nCoV) which was first identified in China. It is totally new and no vaccine or known effective treatment. Therefore, there is high uncertainty regarding probability of getting the disease, its potential severity and chances of controlling it by known preventive measures (Cennimo, 2020; WHO, 2020).

At times of pandemics like the COVID-19, understanding the risk perception of the population, preventive behaviours and finding out the sources of information the public trusts is vital to enable effective communication and respond efficiently (Reintjes R, Das E, Klemm C, Richardus JH, Keßler V, 2016). However, in Ethiopia, little is known about the complex interplay of changing epidemiology, public trust to pandemic communication source, risk perception and public preventive behaviour. Thus, how people perceive the risk is not necessarily related to the actual risk rather influences protective behaviours or leads to reduced likeliness to implement the recommended protective behaviours (Pligt, 1996; Rubin, G. J., Amlot, R., Page, L., & Wessely, 2009). So, we need to deliver evidence-based information, respond to rumours, survey misinformation and encourage rational protective behaviour.

Behavioural insights studies aims at monitoring above discussed issues during the current COVID-19 pandemic and to feed them into the communication and decision making process during the crisis. Moreover, it is important to understand the dynamics of risk perceptions, intention to implement recommended behaviours, misinformation and protective behaviours, understand which of the protective measures are known and which information is lacking. Based on this information it is possible to react to misinformation or suddenly increasing risk perceptions and panics.

Flexibility and adaptation

As the COVID-19 pandemic evolves and the epidemiological and response situation rapidly changes, this study might be continuously updated so that the questions asked reflect the situation and provide the necessary information to shape effective and appropriate outbreak response measures.
Aim of the study
The overall aim is to inform COVID-19 outbreak response measures including interventions and communications.

Objectives
To assess knowledge, risk perception, public trust and preventive practice towards COVID-19

Research Questions
Overall, research questions relate to

- The levels of and changes in risk perceptions, knowledge, used and trusted sources of information, confidence in crisis management, uptake of protective behaviours, at each data collection point.
- How changes in risk perceptions relate to characteristics of the outbreak and other psychological variables such as knowledge, affect and misinformation.
- Whether risk perceptions are positively related to preparedness and protective behaviours and which other factors are relevant correlates of preparedness and protective behaviours (e.g. knowledge, misinformation, trust).
- Knowledge and misinformation about preparedness and preventive measures and whether the level of knowledge is related to certain sources of information.

Note that the cross-sectional design will not allow the assessment will only be snapshots of a current state of the public perceptions. Therefore, there is need to conduct qualitative study so the data can be triangulated.

Study methods
- 15 to 20 minutes online or telephone questionnaire in a serial cross-sectional design with multiple data collections. It is proposed to collect data repeatedly (e.g. every two weeks) for optimal monitoring.

Variables
A standard questionnaire developed by the WHO will be adapted.

Overview of variables (measured variables, details: see questionnaire)

- Demographics (Age, Gender, district size, education)
- Knowledge about the novel coronavirus and COVID-19 (*)
- Individual feeling of preparedness and perceived self-efficacy (*) to avoid an infection with the coronavirus
- Perceived and actual knowledge about effective preventive measures to avoid infection with the coronavirus (*)
- Uptake of preventive measures to avoid infection with COVID-19 (*)
- Risk perceptions regarding the disease (probability, susceptibility, severity) (*)
- Affective measures (feeling of closeness, novelty, threat, fear, and worry regarding the disease) (*)
• Trust and frequency of use of regarding different information channels (*)
• Frequency of information search on COVID-19
• Trust in health authorities, government institutions, media and other relevant stakeholders (*)
• Perceptions and acceptance of policies to control the outbreak (*)
• Rumours regarding COVID-19 (qualitative data, open text fields)

Data collection and analysis
Participants can be recruited via an external study sample provider (Ethio-telecom) or voluntary as for the online.

An automated data analysis website (password protected) has been established by WHO allowing any country fast access to the results. Commented code for data analysis and website are available so it will be used.

Ethical consideration

Also, participants should provide informed consent before starting the questionnaire. The Google form has text on this so it is included in the questionnaire. The research contains negligible risks as there is no more foreseeable risk of harm or discomfort other than potential inconvenience during participation. The study also involves only non-identifiable data about human beings. So Ethical approval will be obtained from Hawassa University IRB

Sample
According to WHO recommendation, to obtain a high level of congruence between the distribution of the demographics in the sample and the population (regarding age, gender and living area), a sample size of n = 1000 per wave is recommended.

Each data collection with n = 1000 participants is suggested as a quota sample, matching the general population in the country in terms of age, gender and state/district.

Limitations of the study

Using online panels limits the participation of certain important population groups, including the elderly (a risk group for COVID-19) and disadvantaged population groups such as homeless people and other vulnerable groups. Phone interviews as a supplement or instead of online panels will be used to mitigate this. However, with the current rapid and dramatic developments, the slow process of phone interviews (i.e. week-long processes) might not provide the immediate feedback needed at any point in time.

Publication of the study protocol
It is suggested that each user of the tool adds its study protocol/questionnaire to the PsychArchives repository as referenced documents. This way they are connected to the WHO standard protocol and over time an overview is provided on country studies.

**Introduction**

Dear Participant,

Thank you for taking part in this study.

This study is conducted by motivated academic staffs in Ethiopia. The study about the novel coronavirus (COVID-19) will take about 15 minutes, and we will ask health-related questions. The study is conducted to **improve actions taken** in response to the novel coronavirus pandemic.

Your answers will be used exclusively for scientific purposes and to help improve novel coronavirus outbreak response in Ethiopia. Please do not start until you will have enough time to complete it in one go. Please close other programmes (e.g. chat or e-mail) to avoid distractions.

This is a non-commercial study financed by none.

Further information:

1. Your participation in the study is voluntary and can be terminated at any time and without giving reasons.
2. Your participation in the research does not expose you to any significant risk.

**Why we collect and use your data**

The survey is about COVID-19. The anonymized data may be used for research and teaching in the future.

**How you can contact us**

Responsible:

Netsanet Abera (netsaneta@hu.edu.et)

[*] I agree to participate in this study and understand that all my answers will only be used for scientific purposes.

I agree to the processing of my personal data in accordance with the information provided here.

I am aware that the data will be published in anonymous form to promote transparency in science.

Which of the following can be symptoms of the novel coronavirus?

Please evaluate all symptoms listed below.

- Fever
  - [*] Related to the newly emerged coronavirus
  - [*] Not related to the newly emerged coronavirus
  - [*] Don’t know

  Cough [Answer scheme: see “Fever”]

  Shortness of breath [Answer scheme: see “Fever”]

  Sore throat [Answer scheme: see “Fever”]

  Runny or stuffy nose [Answer scheme: see “Fever”]

  Muscle or body aches [Answer scheme: see “Fever”]

  Headaches [Answer scheme: see “Fever”]

  Fatigue (tiredness) [Answer scheme: see “Fever”]

  Diarrhea [Answer scheme: see “Fever”]

Which answer is correct?

- [*] There is a drug to treat the novel coronavirus.

- [*] There is a vaccine for the novel coronavirus.

- [*] There is both a drug for the treatment and a vaccine for the novel coronavirus.

- [*] There is currently no drug treatment or vaccine for the novel coronavirus.

- [*] Don’t know

Which of the following is correct about transmission of novel coronavirus?

- [*] The novel coronavirus is transmissible from person to person.

**The novel coronavirus is transmissible from person to person.**

Which of the following is correct about the transmission of the novel coronavirus?

Please select all transmission modes that apply.

[*] The novel coronavirus is transmissible via droplets through coughing, sneezing or intimate contact.

[*] The novel coronavirus is transmissible via the fecal-oral route.

[*] 5G network has relation with COVID19

[*] Don’t know

What is the incubation period (i.e., the time from viral infection to developing symptoms of illness) of the novel coronavirus?

[*] Up to 3 days

[*] Up to 7 days

[*] Up to 14 days

[*] Don’t know
